Dear Clarice,

I read your report in the most recent Oregon Birds, and I guess I hadn't realized that the OBRC wanted notes on Ovenbirds. On 25 May 1983, I was working as a Biological Aid for Malheur NWR, & was mist-netting birds at refuge HQ. Just at dusk I caught and banded an adult male Ovenbird (Band #860-85026). I determined sex by the wing chord measurement of 78mm. The bird had a bright orange crown stripe, olive upper parts, no wing bars; the tertial tips were without rusty edges, and the skull was pneumatized. Identification was confirmed by CD Littlefield, & the bird was shown to Bird class students at the Malheur Field Station. Some students took photos, but I have no idea of who or where the pictures are. The bird was released to continue its migration. Hope this helps.

Best,

Jon. Anderson
